

CA-LC5

LOST CIRCULATION CELLOPHANE

DESCRIPTION

CA-LC5 is a lost circulation additive for cementing operations. The product serves as a bridging agent across fractured or porous areas. It is composed of clear, thin flakes of various sizes.

APPLICATION

CA-LC5 flakes form a mat at the face of the formation or fracture sealing off the lost circulation zone. Some of its advantages are as follows:

- It is chemically inert and does not affect thickening time or compressive strength.
- Small quantities provide a large surface area for sealing off porous zones.
- It is compatible with all commonly used cements and additives.

RECOMMENDED TREATMENT

CA-LC5 is used at concentrations of 1/8 to 1/2 pounds per sack of cement. Mixing problems could occur with concentrations above this amount. Dry blending into the cement at the bulk plant produces the best results.

HANDLING

Eye contact may cause slight irritation or mechanical corneal injury. Contact with skin can cause irritation. Wash exposed areas with water. Goggles are recommended.

PACKAGING

CA-LC5 is available in 25 lb sacks.
