

MESUCO-FLAKE™

CELLOPHANE FLAKES LCM

DESCRIPTION

MESUCO-FLAKE is produced from a special grade of cellophane. The thickness of the cellophane provides strength yet flexibility and the flakes have been sized and creased to provide maximum plugging when in zones of lost circulation.

MESUCO-FLAKE is inert in aqueous fluids and will not be chemically affected by water, salt, acids or any of the normal drilling fluid additives. The product may soften in some oil or invert muds, calling for pilot testing.

MESUCO-FLAKE is available in a mud grade (3/4 inch/1.9 cm cut) or in a cementing grade (3/8 inch/0.95 cm cut).

APPLICATION

MESUCO-FLAKE is particularly effective for combating zones of loss of circulation due to highly permeable or broken, unconsolidated formations.

RECOMMENDED TREATMENT

Concentration required will depend upon the severity of the loss of circulation.

PACKAGING

MESUCO-FLAKE is packaged in 25 lb net multi-ply paper bags.
