

MESUCO-MICA

LOST CIRCULATION MATERIAL

DESCRIPTION

MESUCO-MICA is a selected muscovite (variety) mica. This variety of mica is the most durable of all the micas and is chosen for the strength of the flakes and their resistance to chemical deterioration.

Fine, medium and coarse grades of MESUCO-MICA are available, each grade being free from grit and of a particle size distribution that enhances quick sealing of porous formations.

APPLICATION

MESUCO-MICA is used as a preventive measure against loss of circulation. The coarse MESUCO-MICA is effective in reducing and/or eliminating mild circulation losses in porous formations.

RECOMMENDED TREATMENT

The recommended treatment can be between 3 to 8 ppb (8.6 to 22.8 kg/m³) more or less depending upon the severity of the loss of circulation.

Other loss circulation products are also available such as MESUCO-PLUG, MESUCO-FLAKE, MESUCO-FIBER, KWIKSEAL, etc.

PACKAGING

MESUCO-MICA is packaged in 50 lb net export quality paper bags.

MISCELLANEOUS

For prices, delivery schedules or additional information, contact any of Messina's offices, local agents or distributors.

MESUCO-MICA is a Messina trademark
