

MESUCO-SEAL

BLENDING LCM

DESCRIPTION

MESUCO-SEAL is a select blend of four types of materials normally used for lost circulation: a flake material (cellophane), a granular material (nutshells), and fine and coarse synthetic & natural fibrous material (wood and plant fibers). It is available in various sizes: Fine, Medium, & Coarse.

APPLICATION

Because MESUCO-SEAL is not only a combination of four products but a combination of various particle sizes, it is excellent for the control and elimination of loss of circulation due to fractures, highly permeable zones or broken unconsolidated formations. It takes the guesswork out of the problem since MESUCO-SEAL is designed to handle all lost circulation problems and contains no fermenting materials or materials that chemically change the rheological properties of the fluid - even polymer muds.

RECOMMENDED TREATMENT

- Preventive measure - concentrations 2-10 ppb
- As a "pill" - concentrations 25-40 ppb

PACKAGING

MESUCO-SEAL is packaged in 40 lb net export paper bags. Alternative packaging is available upon request.

MISCELLANEOUS

For prices, delivery schedule, or further information, please contact any Messina office, local representative or distributor.
